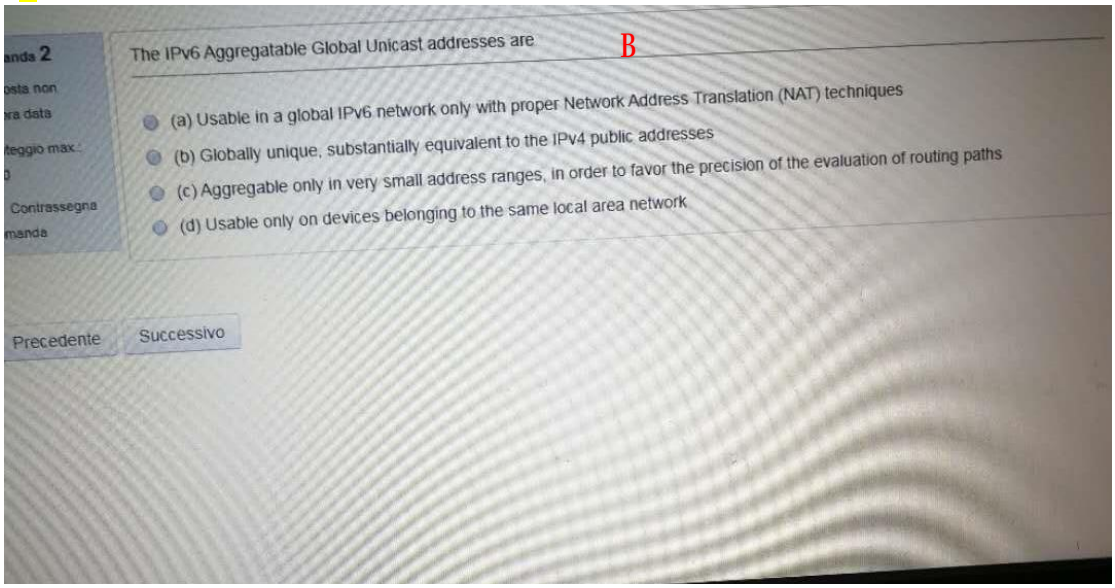
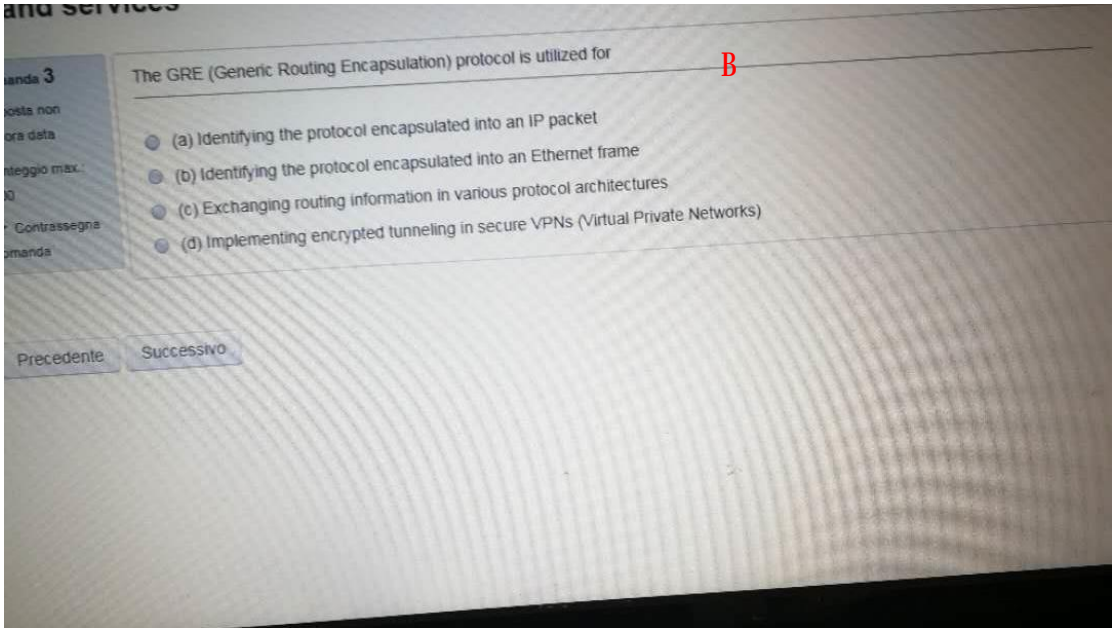
The IGMP protocol B
(a) Allows a host to communicate to other hosts belonging to a given multicast group its own interest in entering the group
(b) Allows a router to communicate to other routers in the Internet network its own interest in receiving the traffic related to a given multicast group
(c) Allows a host to communicate to routers in the network its own interest in receiving the traffic related to a given multicast group
(d) Carries the multicast traffic generated by hosts
Successivo

2A



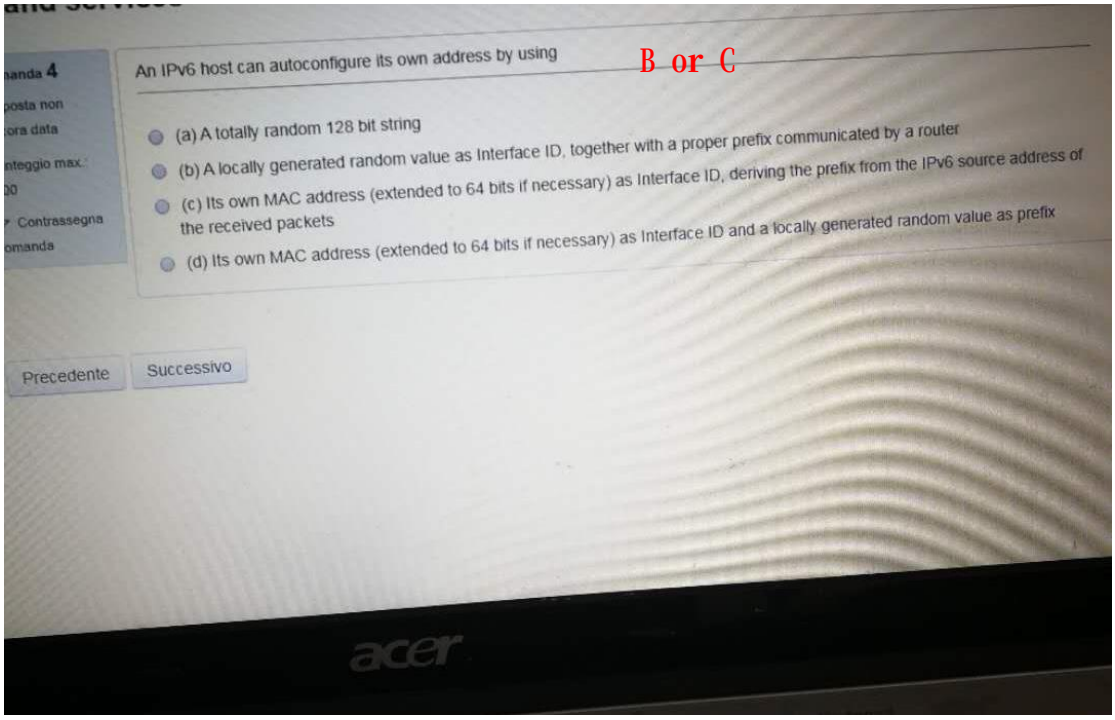
The IPv6 Aggregatable Global Unicast addresses are B
(a) Usable in a global IPv6 network only with proper Network Address Translation (NAT) techniques
(b) Globally unique, substantially equivalent to the IPv4 public addresses
(c) Aggregable only in very small address ranges, in order to favor the precision of the evaluation of routing paths
(d) Usable only on devices belonging to the same local area network
Precedente
Successivo

3A



The GRE (Generic Routing Encapsulation) protocol is utilized for
B
(a) Identifying the protocol encapsulated into an IP packet
(b) Identifying the protocol encapsulated into an Ethernet frame
(c) Exchanging routing information in various protocol architectures
(d) Implementing encrypted tunneling in secure VPNs (Virtual Private Networks)
Precedente
Successivo

4



An IPv6 host can autoconfigure its own address by using
B or C
(a) A totally random 128 bit string
(b) A locally generated random value as Interface ID, together with a proper prefix communicated by a router
(c) Its own MAC address (extended to 64 bits if necessary) as Interface ID, deriving the prefix from the IPv6 source address of the received packets
(d) Its own MAC address (extended to 64 bits if necessary) as Interface ID and a locally generated random value as prefix

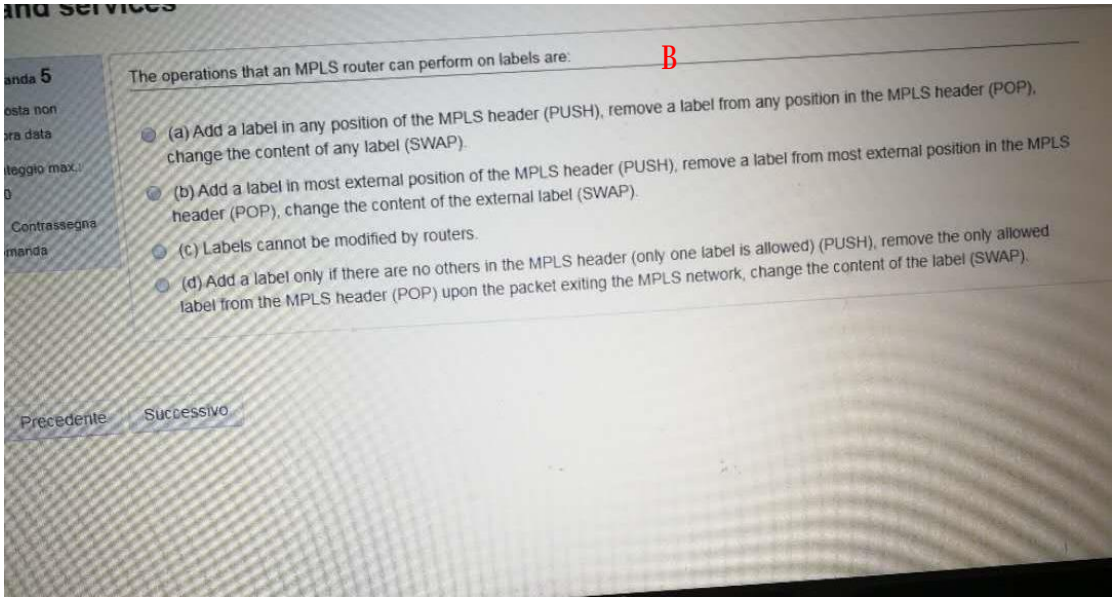
5.B



The operations that an MPLS router can perform on labels are:
B
(a) Add a label in any position of the MPLS header (PUSH), remove a label from any position in the MPLS header (POP), change the content of any label (SWAP).
(b) Add a label in most external position of the MPLS header (PUSH), remove a label from most external position in the MPLS header (POP), change the content of the external label (SWAP).
(c) Labels cannot be modified by routers.
(d) Add a label only if there are no others in the MPLS header (only one label is allowed) (PUSH), remove the only allowed label from the MPLS header (POP) upon the packet exiting the MPLS network, change the content of the label (SWAP).
Precedente

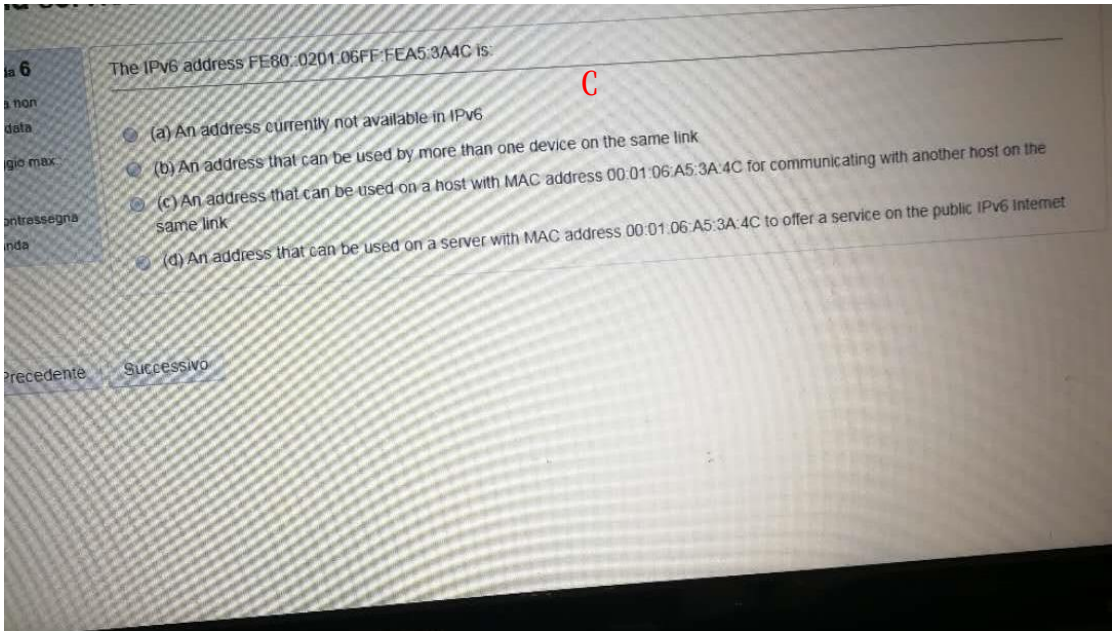
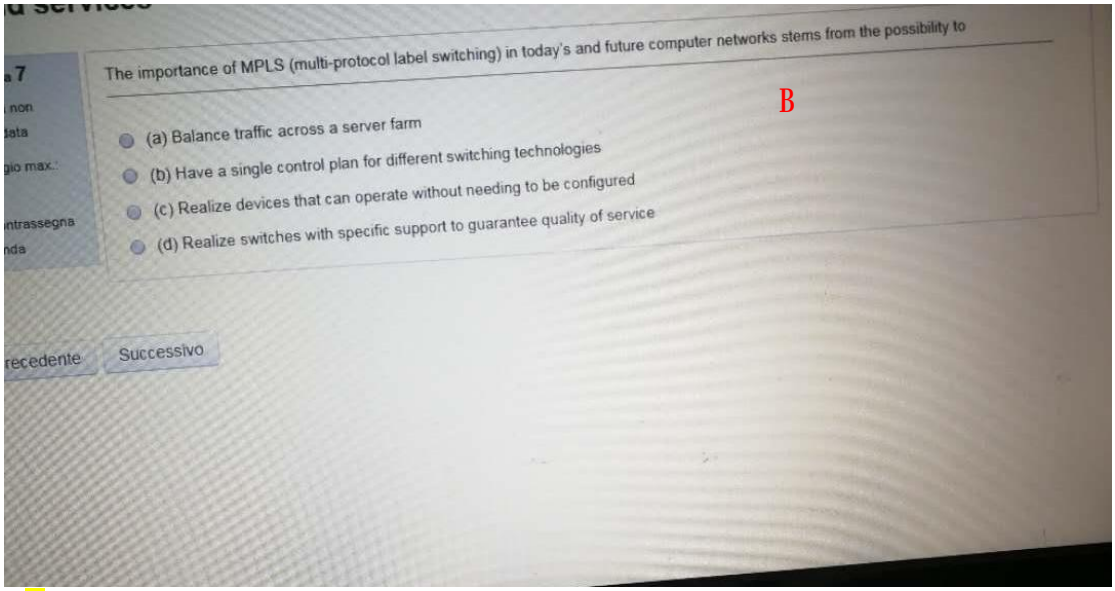
6.C



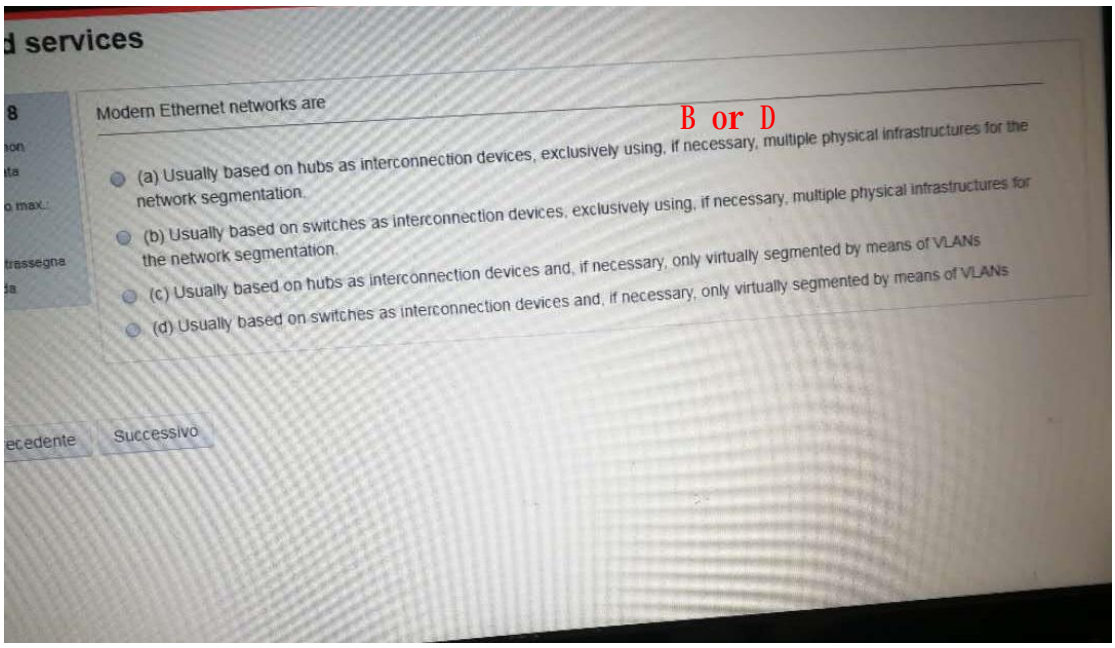
The IPv6 address FE80::0201:06FF:FEA5:3A4C is:
C
(a) An address currently not available in IPv6
(b) An address that can be used by more than one device on the same link
(c) An address that can be used on a host with MAC address 00:01:06:A5:3A:4C for communicating with another host on the same link
(d) An address that can be used on a server with MAC address 00:01:06:A5:3A:4C to offer a service on the public IPv6 Internet
Successivo

7.B



The importance of MPLS (multi-protocol label switching) in today's and future computer networks stems from the possibility to
B
(a) Balance traffic across a server farm
(b) Have a single control plan for different switching technologies
(c) Realize devices that can operate without needing to be configured
(d) Realize switches with specific support to guarantee quality of service
Successivo

8.D



services
Modern Ethernet networks are
B or D
(a) Usually based on hubs as interconnection devices, exclusively using, if necessary, multiple physical infrastructures for the network segmentation.
(b) Usually based on switches as interconnection devices, exclusively using, if necessary, multiple physical infrastructures for the network segmentation.
(c) Usually based on hubs as interconnection devices and, if necessary, only virtually segmented by means of VLANs
(d) Usually based on switches as interconnection devices and, if necessary, only virtually segmented by means of VLANs
